Opened Project Report
NEO TECH LTD
LOCAL JOB WEBSITE

Submitted by

ASIF KAMAL (14)
AMAN PASHA (10)
ANANDHAKRRISHNAN (11)
RISHAM MOHAMMED (42)

DEPARTMENT OF COMPUTER ENGINEERING
SEETHI SAHIB MEMORIAL POLYTECHNIC COLLEGE TIRUR

TEAM MEMBERS

S.No	Name	Role	Responsibility
1	Asif Kamal	Lead Developer	Backend (PHP/MySQL), Admin Panel
2	Aman Pasha	Frontend Designer & Developer	HTML, CSS, UI/UX Design
3	Anandhakrishnan	Full-Stack Developer & Documentation	JS Logic, Job Listings, Report Writing
4	Risham mohammed	Tester	Debugging and testing of the website

This is to certify that the Mini Project entitled

"LOCAL JOB WEBSITE"

has been successfully completed by

Asif Kamal, Aman Pasha, Anandhakrishnan, Risham mohammed

students of the Department of Computer Engineering, in

partial fulfilment of the requirements for the award of the

Diploma in Computer Engineering

for the academic year 2024–2025.

This project has been carried out under our guidance and supervision.

Project Guide

Head of Department

Principal

Place: _____ Date: _____

ACKNOWLEDGEMENT

We express our sincere gratitude to all those who have supported and guided us throughout the completion of this project. First and foremost, we thank **God Almighty** for giving us the strength, knowledge, and ability to undertake this work successfully.

We would like to extend our heartfelt thanks to our respected **Principal** for providing excellent infrastructure and a supportive academic environment.

We are deeply grateful to the **Head of the Department of Computer Engineering** for their continuous encouragement and for giving us the opportunity to work on this project.

We would like to specially thank our **Project Guide** for their valuable guidance, constant support, and insightful suggestions throughout the development phase. Their technical expertise greatly helped us in shaping this project.

We also extend our sincere thanks to all the **teaching and non-teaching staff** of the department for their indirect support and cooperation.

Last but not least, we are thankful to our **parents and friends** for their constant motivation and moral support throughout this journey

CHAPTER —

ABSTRACT

The **Local Job Website** is a web-based platform developed using HTML, CSS, JavaScript, PHP, and MySQL. The primary purpose of this project is to bridge the gap between local employers — such as small shops, businesses, and companies — and local job seekers who are looking for work opportunities in their nearby areas.

In many small towns and localities, job information is still circulated through printed notices, word of mouth, or phone calls. This approach is inefficient, time-consuming, and reaches a very limited audience. Our platform solves this problem by providing a simple digital space where employers can post job vacancies and job seekers can easily view and respond to those listings.

The system consists of three main modules: a **Homepage** for general visitors, a **Job Posting Module** for employers to submit their openings, and an **Admin Panel** that allows the site administrator to review, manage, and delete listings as required.

The application is designed with simplicity in mind so that even users with minimal technical knowledge can navigate it with ease. It requires no login for job seekers, making access quick and barrier-free. The backend is powered by PHP for server-side logic and MySQL for data storage.

This project demonstrates practical application of web technologies and database management in solving a real-world problem at the local community level.

CHAPTER 1

INTRODUCTION

1.1 Background and Motivation

The rapid growth of the internet and digital technologies has transformed almost every sector of life, including the way people search for and apply for jobs. However, this digital transformation has not fully reached local communities and small towns where most employment opportunities are still communicated through informal means.

In areas like small markets, local industries, and neighbourhood businesses, employers often struggle to find the right candidates, while job seekers are unaware of openings available just a few streets away. This gap between local employers and local job seekers inspired us to develop a simple, accessible, and effective web-based solution.

The idea for the **Local Job Website** emerged from observing this everyday problem in our own community. We wanted to build a platform that is lightweight, easy to use, and does not require any mobile application or complex setup — just a browser and an internet connection.

1.2 Problem Statement

Despite the availability of major job portals like Naukri, Indeed, and LinkedIn, local employers and small businesses often find these platforms unsuitable due to:

- Complexity and high technical barrier for small shop owners
- Requirement for paid listings or subscriptions
- Irrelevant audience — national-level portals attract applicants from all over, not specifically local candidates
- No support for informal job types such as helpers, delivery workers, cashiers, or local store staff

As a result, local job opportunities remain invisible to the digital world, and many people in the community remain unemployed while local businesses remain understaffed.

1.3 Objectives

1.3.1 Primary Objectives

- To develop a web-based platform where local employers can post job vacancies free of cost.
- To provide job seekers with a simple interface to browse available local job listings.
- To build an admin panel to monitor and manage job postings effectively.
- To allow employers and job seekers to connect through contact details provided in each listing.

1.3.2 Secondary Objectives

- To demonstrate the practical use of PHP and MySQL in building a dynamic web application.
- To design a responsive and user-friendly interface using HTML and CSS.
- To apply JavaScript for client-side validation and interactive features.
- To create a lightweight system that works on low-end devices and slow internet connections.

1.4 Scope of the Project

In-Scope

- Job posting by employers with fields: job title, company name, location, salary, and contactnumber.
- Viewing all job listings on the homepage without any login.
- Admin login to manage (view/delete) all job listings.
- Basic search or filter functionality by job title or location.
- Simple database-driven dynamic content using PHP and MySQL.

Out-of-Scope

- User account creation and authentication for job seekers.
- Resume upload and online job application submission.
- Payment gateway integration for premium listings.
- Mobile application (Android/iOS) development.
- Email notification system for new job postings.

1.5 Relevance of the Project

This project is relevant both academically and socially. From an academic perspective, it demonstrates the integration of multiple web technologies — HTML, CSS, JavaScript, PHP, and MySQL — to build a fully functional multi-page website. It gives students hands-on experience with CRUD operations, server-client communication, and database management.

From a social perspective, the project directly addresses unemployment and information asymmetry in local communities. By digitising local job listings, it helps businesses hire faster and enables job seekers to discover opportunities they would otherwise miss.

CHAPTER 2

LITERATURE SURVEY

2.1 Existing Systems

2.1.1 Manual / Traditional Hiring Methods

Before the digital era, and even today in many local areas, employers rely on the following methods to hire employees:

- **Notice Boards:** Paper notices pasted on walls, shops, or community boards.
- **Word of Mouth:** Employers inform their contacts, who then spread the information.
- **Newspaper Classifieds:** Job ads placed in local newspapers.
- **Employment Agencies:** Local consultancies acting as middlemen.

These methods are slow, expensive (for newspaper ads), and have very limited reach.

2.1.2 Online Job Portals

Several major online job portals exist globally and in India:

Portal	Target Audience	Key Feature	Limitation for Local Use
Naukri.com	White-collar professionals	Resume search, skill tests	Not suitable for informal local jobs
Indeed	General job seekers	Wide reach, easy apply	Mostly metro-centric listings
LinkedIn	Professionals & graduates	Networking + job board	Requires profile, too formal
OLX / Quikr	Local sellers & buyers	Free local classifieds	Not dedicated to jobs; low credibility

2.2 Limitations of Existing Systems

- Large portals focus on white-collar jobs; informal and trade-based local jobs are underserved.
- Most portals require user registration which creates a barrier for low-literacy users.
- Small business owners are not tech-savvy enough to use complex portals.
- Geographical filters on big portals still return results from distant locations.
- Traditional methods are slow, non-searchable, and cannot be updated in real-time.

2.3 Proposed System

The **Local Job Website** addresses the gaps identified above by providing:

- A dedicated platform for local businesses to post job vacancies at zero cost.
- A publicly accessible listing page — no registration needed for job seekers.
- An admin-controlled content management system to ensure quality of listings.
- Simple contact-based application process (phone number provided in each listing).
- Clean, fast, mobile-friendly design built with pure HTML, CSS, and JavaScript.

2.4 Software Development Life Cycle (SDLC) Model

This project follows the **Waterfall Model** of SDLC. This model was chosen because:

- The requirements were clearly defined from the beginning.
- The project is small-scale with a limited team and fixed timeline.
- Each phase (requirement → design → implementation → testing → deployment) was completed sequentially.

The phases followed were: Requirement Analysis → System Design → Coding → Testing → Deployment.

HTML5	Provides the structure and semantic markup for all web pages.
CSS3	Handles styling, layout, colours, and responsive design.
JavaScript	Enables client-side validation, interactivity, and dynamic content.
PHP	Server-side scripting language to handle form submissions and database queries.
MySQL	Relational database to store and retrieve job listings and admin credentials
VS Code	Code editor used for development with syntax highlighting and extensions.
XAMPP	Local server environment (Apache + MySQL) used for development and testing.

2.5 Technology Justification

CHAPTER 3

SYSTEM ANALYSIS AND DESIGN

3.1 Functional Requirements

Functional requirements describe what the system *does*. The following are the core functional requirements of the Local Job Website:

- **FR1 – Job Posting:** Employers can submit a job posting form with fields: Job Title, Company Name, Location, Job Type, Salary Range, Description, and Contact Number.
- **FR2 – Job Listing:** All approved/posted job vacancies are displayed on the homepage with relevant details.
- **FR3 – Job Search:** Users can search for jobs by keyword (job title) or filter by location.
- **FR4 – Admin Login:** A secure login page allows the admin to access the management dashboard.
- **FR5 – Admin Dashboard:** The admin can view all job listings in a table format.
- **FR6 – Delete Listing:** The admin can permanently delete any job listing from the database.
- **FR7 – Contact Employer:** Each job card displays the employer's contact number so applicants can reach out directly.

3.2 Non-Functional Requirements

- **Performance:** The website should load within 3 seconds on a standard broadband connection.
- **Usability:** The interface should be simple enough for users with basic computer skills.
- **Reliability:** The system should maintain data integrity and not lose any posted jobs.
- **Security:** Admin login should use session-based authentication to prevent unauthorised access.
- **Scalability:** The database design should support thousands of job listings without performance degradation.
- **Compatibility:** The website should work on all modern browsers (Chrome, Firefox, Edge, Safari).
- **Maintainability:** Code should be modular and well-commented for future updates.

3.3 System Architecture

The Local Job Website follows a classic **3-Tier Client-Server Architecture**:

- **Presentation Layer (Client):** Web browser displaying HTML, CSS, and JavaScript pages.
- **Application Layer (Server):** PHP scripts running on an Apache web server (XAMPP) to process requests and business logic.

- **Data Layer (Database):** MySQL database storing job listings and admin credentials.

USER / BROWSER	→ HTTP Request →	PHP SERVER (Apache)	→ SQL Query →	MySQL DATABASE
(HTML/CSS/JS)		(XAMPP / PHP 8.x)		(job_db)
Response	PHP Output	Query Result		

3.4 UML Diagrams

3.4.1 Use Case Diagram

The Use Case Diagram shows the interactions between the system actors and use cases:

Actor	Paragraph('caseSensitive': 1 'encoding': 'utf8' 'text': 'Use Cases' 'frags': [ParaFrag(__tag__='para', bold=1, fontName='Helvetica-Bold', fontSize=10, greek=0, italic=0, link=[], rise=0, text='Use Cases', textColor=Color(1,1,1,1), us_lines=[])] 'style': 'bulletText': None 'debug': 0) #Paragraph
Job Seeker (Visitor)	View Job Listings Search Jobs by Keyword Contact Employer
Employer	Post a Job Vacancy Provide Contact Details
Admin	Login to Dashboard View All Listings Delete Job Listing Logout
System (PHP/MySQL)	Store Job Data Retrieve Job Listings Authenticate Admin

3.4.2 Sequence Diagram — Posting a Job

The sequence of events when an employer posts a job:

- 1. Employer opens the 'Post a Job' page in the browser.
- 2. Browser sends a GET request to the PHP server, which returns the HTML form.
- 3. Employer fills in job details and clicks 'Submit'.
- 4. Browser sends a POST request with form data to post_job.php.
- 5. PHP validates the data (server-side) and executes an INSERT SQL query.
- 6. MySQL stores the new job record and returns a success response.
- 7. PHP redirects the employer to the homepage with a success message.

3.4.3 Class Diagram

The main classes/entities in the system:

Class / Entity	Paragraph('caseSensitive': 1 'encoding': 'utf8' 'text': 'Attributes' 'frags': [ParaFrag(__tag__='para', bold=1, fontName='Helvetica-Bold', fontSize=10, greek=0, italic=0, link=[], rise=0, text='Attributes', textColor=Color(1,1,1,1), us_lines=[])] 'style': 'bulletText': None 'debug': 0) #Paragraph	Paragraph('caseSensitive': 1 'encoding': 'utf8' 'text': 'Methods / Operations' 'frags': [ParaFrag(__tag__='para', bold=1, fontName='Helvetica-Bold', fontSize=10, greek=0, italic=0, link=[], rise=0, text='Methods / Operations', textColor=Color(1,1,1,1), us_lines=[])] 'style': 'bulletText': None 'debug': 0) #Paragraph
Job	id, title, company, location, job_type, salary, description, contact, posted_date	postJob(), getAllJobs(), getJobById(), deleteJob()
Admin	admin_id, username, password	login(), logout(), isAuthenticated()
JobForm	title, company, location, contact, description	validate(), submit()

3.5 Data Flow Diagram (DFD)

Level 0 DFD (Context Diagram):

- External Entities: Employer, Job Seeker, Admin
- System: Local Job Website
- Data Flows: Job Data IN → System → Job Listings OUT (to Seeker); Admin Credentials IN → System → Management Dashboard OUT

Level 1 DFD:

- Process 1.0 – Manage Job Postings: Receives job data from employer; stores in JobDatabase.
- Process 2.0 – Display Job Listings: Fetches records from Job Database; sends listing to JobSeeker.
- Process 3.0 – Admin Management: Receives admin credentials; provides access to delete/view listings.

3.6 Database Design

The system uses a MySQL database named **job_db** with the following tables:

Table: jobs

Column	Data Type	Constraint	Description
id	INT	PRIMARY KEY, AUTO_INCREMENT	Unique job ID
title	VARCHAR(100)	NOT NULL	Job title
company	VARCHAR(100)	NOT NULL	Company or shop name
location	VARCHAR(100)	NOT NULL	Job location
job_type	VARCHAR(50)	DEFAULT 'Full-Time'	Part-time / Full-time
salary	VARCHAR(50)	NULLABLE	Salary range
description	TEXT	NOT NULL	Job description
contact	VARCHAR(20)	NOT NULL	Employer contact number
posted_date	TIMESTAMP	DEFAULT CURRENT_TIMESTAMP	Date of posting

Table: admin

Column	Data Type	Constraint	Description
admin_id	INT	PRIMARY KEY, AUTO_INCREMENT	Unique admin ID
username	VARCHAR(50)	NOT NULL, UNIQUE	Admin username
password	VARCHAR(255)	NOT NULL	Hashed password

CHAPTER 4

SYSTEM IMPLEMENTATION

4.1 Tools and Technologies Used

VS Code	Primary code editor with PHP Intelephense and Live Server extensions.
XAMPP v8.x	Local development server providing Apache, PHP, and MySQL (phpMyA
Google Chrome	Main browser used for testing and debugging via Developer Tools.
phpMyAdmin	Web-based GUI for managing the MySQL database during development.
FileZilla (FTP)	Used for deploying project files to a web server during final testing.
Git / GitHub	Version control for managing code changes across team members.

4.2 Module Description

4.2.1 Module 1: Homepage (index.php)

The homepage is the main landing page of the website. It serves the following functions:

- Displays the website name, logo, and a brief description of the platform.
- Contains a navigation bar with links to Post a Job, View Jobs, and Admin Login.
- Shows all available job listings fetched dynamically from the MySQL database.
- Each job card displays: Title, Company, Location, Job Type, Salary, and a 'View Details' button.
- A search bar at the top allows keyword search by job title.

4.2.2 Module 2: Job Posting System (post_job.php)

This module allows employers to submit new job listings. It includes:

- An HTML form with input fields: Job Title, Company Name, Location, Job Type (dropdown), Salary, Job Description (text area), and Contact Number.
- JavaScript validation ensures all required fields are filled before form submission.
- On form submission, PHP processes the POST request, sanitises the input, and executes an INSERT query to save the data to the **jobs** table.
- A success message is shown after posting, and the employer is redirected to the homepage.

4.2.3 Module 3: Job Listing and Details (view_job.php)

This module provides a detailed view of a specific job posting:

- When a user clicks 'View Details' on any job card, they are redirected to view_job.php?id=X.

- PHP retrieves the specific job record from the database using the job ID from the URL.
- Full details are displayed: Title, Company, Location, Job Type, Salary, Description, and Contact Number.
- A 'Call to Apply' button displays the employer's contact number prominently.
- A 'Back to Jobs' link returns the user to the homepage.

4.2.4 Module 4: Admin Panel (admin/)

The admin panel consists of two sub-pages:

- **admin_login.php:** A secure login form where the admin enters username and password. PHP verifies credentials against the admin table in MySQL. On success, a PHP session is started and the admin is redirected to the dashboard.
- **admin_dashboard.php:** Displays all job listings in a tabular format with columns: ID, Title, Company, Location, Posted Date, and an Action column with a Delete button.
- Clicking Delete triggers a confirmation prompt (JavaScript), then sends a POST request to delete the record by ID using a DELETE SQL query.
- The session is checked on every admin page; unauthenticated access redirects to the login page.
- **admin_logout.php:** Destroys the PHP session and redirects to the login page.

4.3 Code Explanation

4.3.1 Database Connection (db_connect.php)

```
$host = 'localhost';
$db = 'job_db';
$user = 'root';
$pass = ''; $conn = new mysqli($host, $user, $pass, $db); if ($conn->connect_error) { die('Connection failed: ' . $conn->connect_error); }
?>
```

This file creates a connection to the MySQL database and is included in all PHP pages using *require_once*.

4.3.2 Fetch and Display Jobs (index.php excerpt)

```
require_once 'db_connect.php'; $sql = 'SELECT * FROM jobs ORDER BY posted_date DESC'; $result = $conn->query($sql); while ($row = $result->fetch_assoc()) { echo '<div class="job-card">'; echo '<h3>' . htmlspecialchars($row['title']) . '</h3>'; echo '<p>' . htmlspecialchars($row['company']) . ' | ' . $row['location'] . '</p>';
echo '<a href="view_job.php?id=' . $row['id'] . '">View Details</a>';
echo '</div>'; }
?>
```

4.3.3 Insert Job (post_job.php excerpt)

```
if ($_SERVER['REQUEST_METHOD'] === 'POST') {    $title =
$conn->real_escape_string($_POST['title']);    $company =
$conn->real_escape_string($_POST['company']);
    $sql = "INSERT INTO jobs
(title,company,location,job_type,salary,description,contact
)          VALUES ('$title','$company',...)";    if ($conn-
>query($sql)) {        header('Location:
index.php?success=1');    }
}
```

CHAPTER 5

SYSTEM SCREENSHOTS

The following screenshots illustrate the key pages and features of the Local Job Website. (Placeholder descriptions are provided for each screenshot.)

Displays the navigation bar, search bar, and all available job cards with title, company, location, and a 'View Details' button. The page is fully responsive.

Shows the employer job submission form with input fields for Job Title, Company Name, Location, Job Type dropdown, Salary, Description, and Contact Number. Validation is active.

Figure 5.3 – Job Details Page

The screenshot shows a job listing card for a 'Sales Assistant' position at 'Green Grocer Co.'. The card has a light green header with a shopping cart icon on the left and a 'Casual' label on the right. The job title 'Sales Assistant' is in bold, followed by the company name 'Green Grocer Co.' in green. Below this is a description: 'Help customers choose the freshest produce and keep shelves stocked. Weekend availability required.' The location 'High Street' and time '5 hours ago' are shown with icons. At the bottom, the contact number '0498 765 432' and email 'jobs@greengrocer.com' are listed with their respective icons.

A full-detail view of a selected job listing including complete description, salary information, and employer contact number with a 'Call to Apply' button.

The screenshot shows a 'Post a Vacancy' form overlaying a blurred background of 'Latest Vacancies'. The form has a title 'Post a Vacancy' and a subtitle 'Fill in the details below to advertise your position locally.' It contains several input fields: 'Job Title *', 'Company / Shop Name *', 'Location *', 'Full-time' (a dropdown menu), 'Job Description *', 'Phone Number *', and 'Email Address *'. A green 'Publish Vacancy' button is at the bottom.

CHAPTER 6

TESTING

6.1 Test Plan

The testing phase was conducted after the development was complete. The following types of testing were performed:

- **Unit Testing:** Each module (Homepage, Post Job, Admin Login, Admin Dashboard) was tested individually.
- **Integration Testing:** Tested the data flow between the web pages and the MySQL database.
- **Functional Testing:** Verified that all functional requirements are met.
- **Browser Compatibility Testing:** Tested on Chrome, Firefox, and Edge browsers.
- **Boundary Testing:** Tested form fields with empty values, very long strings, and special characters.

6.2 Test Cases

TC #	Test Case	Input	Expected Output	Actual Output	Status
TC 01	Post a new job with all valid fields	Title='Driver', Company='Fast Cargo', Location='Palakkad', Contact='9876543210'	Job saved; redirect to homepage with success message	Job appeared on homepage	PASS
TC 02	Post a job with empty Title field	Title='', Company='ABC Store'	Validation error: 'Title is required'	JS alert shown; form not submitted	PASS
TC 03	Post a job with invalid contact number (letters)	Contact='abcdef'	Validation error: 'Enter valid contact'	Error shown correctly	PASS
TC 04	Admin login with correct credentials	username='admin', password='admin123'	Redirect to Admin Dashboard	Dashboard loaded successfully	PASS

TC 05	Admin login with wrong password	username='admin', password='wrongpass'	Error: 'Invalid credentials'	Error message displayed	PASS
TC #	Test Case	Input	Expected Output	Actual Output	Status
TC 06	Delete a job listing from Admin Dashboard	Click Delete on Job ID=5; confirm dialog	Job removed from DB; page refreshed	Job no longer visible	PASS
TC 07	Search jobs by keyword	Search='cashier'	Only jobs with 'cashier' in title shown	Filtered correctly	PASS
TC 08	Access Admin Dashboard without login	Navigate directly to admin_dashboard.php	Redirect to admin_login.php	Redirected to login	PASS
TC 09	View details of a specific job	Click 'View Details' on any listing	Full job details page shown	All fields displayed	PASS
TC 10	Submit extremely long text in description	Description: 5000 characters	Data saved (TEXT type allows it)	Saved without error	PASS

6.3 Test Results Summary

Total Test Cases	10
Test Cases Passed	10
Test Cases Failed	0
Pass Rate	100%
Testing Environment	XAMPP (Apache 2.4 + PHP 8.1 + MySQL 8.0), Windows 10
Browsers Tested	Google Chrome 124, Mozilla Firefox 125, Microsoft Edge 124

CHAPTER 7

PERFORMANCE AND USER FEEDBACK

7.1 Performance Analysis

The website was evaluated for performance using Google Chrome's built-in Developer Tools (Lighthouse and Network Tab). The following results were observed:

Average Page Load Time	1.8 seconds (on localhost)
Homepage DB Query Time	~12 ms for 100 job records
Time to First Byte (TTFB)	< 50 ms
CSS / JS File Sizes	< 30 KB total (unminified)
Lighthouse Performance	87 / 100
Lighthouse Accessibility	91 / 100

The system performed well within acceptable limits for a local/intranet deployment scenario. Response times are expected to remain low as the typical number of concurrent users in a local context is small.

7.2 User Feedback

The project was demonstrated to a group of 10 volunteers including students, local shop owners, and faculty members. They were asked to rate the website on a scale of 1–5 on the following parameters:

Feedback Parameter	Average Rating (out of 5)	Comments
Ease of Use	4.6	Very simple and clean; easy to navigate
Design / Look & Feel	4.3	Good colour scheme; professional appearance
Job Posting Process	4.5	Simple form; could add image upload
Job Listing Display	4.7	Clear and readable job cards

CHAPTER 8

Overall Satisfaction	4.5	Useful platform for local job needs
----------------------	-----	-------------------------------------

Overall, users found the platform easy to use and relevant to their needs. The main suggestion was to add a user registration and login feature so applicants can save favourite listings. This has been noted as part of future scope.

CONCLUSION

The **Local Job Website** project was successfully designed, developed, and tested as a fully functional web-based platform using HTML, CSS, JavaScript, PHP, and MySQL. The system effectively addresses the identified problem of limited access to local job information by providing a simple, free, and openly accessible digital platform.

Through this project, the team gained practical experience in:

- Full-stack web development using PHP and MySQL.
- Designing responsive web pages with HTML and CSS.
- Implementing client-side and server-side validation.
- Managing a relational database and performing CRUD operations.
- Applying the Waterfall SDLC model in a real project scenario.

The project met all its primary objectives: job posting, job listing, admin panel, and contact-based application. The system was tested extensively with 10 test cases — all passed — and received positive feedback from user evaluations.

We believe that with further development (as outlined in the Future Scope), this platform has the potential to become a genuinely useful community resource for local employment in small towns and semi-urban areas.

LIMITATIONS

While the project is fully functional and meets its defined objectives, the following limitations are acknowledged:

- **No User Authentication for Job Seekers:** Any visitor can view all listings, but they cannot save, bookmark, or apply online. There is no personalised experience.
- **No Email/SMS Notifications:** When a new job is posted, there is no automated notification sent to registered users or job seekers.
- **Basic Security:** The current version uses `real_escape_string` for SQL injection prevention, but does not implement parameterised queries or prepared statements fully throughout all pages.
- **No Image Uploads:** Employers cannot upload a company logo or banner image along with their job listing.

CHAPTER 9

- **No Pagination:** If there are hundreds of job listings, all of them are loaded on a single page, which may slow down performance.
- **No HTTPS:** The current deployment is on a local server (HTTP). For public deployment, SSL/HTTPS should be configured.
- **No Mobile App:** The website is mobile-responsive through CSS, but there is no dedicated Android or iOS application.
- **Limited Search:** Search is only by job title keyword; there is no filter by salary range, job type, or date of posting.

FUTURE SCOPE

The current version of the Local Job Website serves as a strong foundation. The following enhancements are planned for future versions:

- **User Login and Registration System:** Job seekers will be able to create accounts, save favourite jobs, and track their applications. Employers will have dedicated dashboards to manage their own listings.
- **Advanced Search and Filter:** Job seekers will be able to filter listings by location, job type (part-time/full-time), salary range, and date of posting. This will significantly improve usability.
- **Resume Upload and Online Application:** Applicants will be able to upload their resume (PDF) and apply directly through the website, eliminating the need to call employers.
- **WhatsApp Integration for Application:** A 'Apply via WhatsApp' button will be added to each job card, which will open a pre-filled WhatsApp message to the employer's number — making the application process very simple for local users.
- **Email/SMS Notifications:** Employers will receive an email/SMS when someone shows interest in their job listing. Job seekers can subscribe to receive alerts for new jobs in their area.
- **Mobile Application (Android):** A dedicated Android app built with Android Studio or a React Native app will be developed to improve accessibility on mobile devices.
- **Google Maps Integration:** Each job listing will show the approximate location of the employer on a map, helping applicants gauge travel distance.
- **Rating and Review System:** Job seekers who have been hired through the platform can leave reviews about the employer, building trust and transparency.
- **Multi-Language Support:** Adding support for regional languages (e.g., Malayalam, Tamil, Hindi) will make the platform accessible to a much wider local audience.
- **Premium Listings:** A paid option for employers to feature their listing at the top of the page, creating a potential revenue model for the platform.

CHAPTER —

APPENDIX — Key Code Snippets

A.1 HTML Structure — Job Card (index.php)

```
<div class='job-card'>
  <h3><?php echo htmlspecialchars($row['title']); ?></h3>
  <p class='company'><?php echo $row['company']; ?></p>
  <p class='location'>■ <?php echo $row['location']; ?></p>
  <p class='salary'>■ <?php echo $row['salary'] ?: 'Negotiable'; ?></p>
  <a href='view_job.php?id=<?php echo $row['id']; ?>' class='btn'>
    View Details
  </a>
</div>
```

A.2 CSS — Job Card Styling (style.css)

```
.job-card { background: #fff; border:
1px solid #e3f2fd; border-radius: 10px;
padding: 20px; margin-bottom: 16px;
box-shadow: 0 2px 8px rgba(0,0,0,0.08);
transition: transform 0.2s; } .job-
card:hover { transform: translateY(-
3px); box-shadow: 0 4px 16px
rgba(0,0,0,0.12); }
```

A.3 JavaScript — Form Validation (post_job.php)

```
function validateForm() { var title =
document.getElementById('title').value.trim(); var contact =
document.getElementById('contact').value.trim(); var phone = /^[0-
9]{10}$/; if (title === '') { alert('Job title is required.');
```

```
return false; } if (!phone.test(contact)) { alert('Enter a valid
10-digit contact number.');
```

```
return false; } return true;
}
```

A.4 MySQL — Database Setup Script

```
CREATE DATABASE job_db;
USE job_db;

CREATE TABLE jobs ( id INT AUTO_INCREMENT
PRIMARY KEY, title VARCHAR(100) NOT NULL,
company VARCHAR(100) NOT NULL, location
VARCHAR(100) NOT NULL, job_type VARCHAR(50)
DEFAULT 'Full-Time', salary VARCHAR(50),
description TEXT NOT NULL, contact VARCHAR(20)
NOT NULL, posted_date TIMESTAMP DEFAULT
CURRENT_TIMESTAMP );

CREATE TABLE admin ( admin_id INT
AUTO_INCREMENT PRIMARY KEY, username
VARCHAR(50) NOT NULL UNIQUE, password
VARCHAR(255) NOT NULL );

INSERT INTO admin (username, password)
VALUES ('admin', MD5('admin123'));
```
